The scion was a open-pollinated (very probably selfed) seedling of poncirus trifoliata cv Pomeroy that was selected as homozygous for the Ctv resistance gene. The rootstock was sweet orange infected with citrus tristeza virus (CTV) isolate T514 over 1 year before sampling (CTV infects sweet orange, but not genotypes carrying the Ctv resistance gene. Shoots 10-30 cm long were harvested in October 2000, and the green phloem (bark) was removed and frozen quickly in dry ice. Total RNA was purified, a cDNA library was made, and 0.5 million primary lambda cDNA clones were in vivo excised to give a population of pBluescript SK(-) phagemids. All steps to this point were performed in the ML Roose lab at the University of California, Riverside by X. Ye. Phagemids were plated, plasmid DNA purified, cDNA clones archived, and DNA sequences determined bi-directionally using an ABI3730 at the University of California Riverside Genomics Institute, Core Instrumentation Facility. (Choi. Kingan).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Core Instrumentation Pacility, (Choi, Kingan).

Chromatogram files were transmitted to UC Riverside (by Choi), then processed at UC Riverside (by Wanamaker) using the HarvEST pipeline (http://harvest.ucr.edu) to remove vector and cloning oligo sequences and various contaminants, and to trim to a high quality region.

Sequences that retained a phred 17 region of at least 100 bases were deposited to GenBank."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /clone lib="Poncirus trifoliata CTV-challenged cDNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9097874437
                                                                                                                                                       Indiany - Mod.

Site_1: EcoRI; Site_2: XhoI; Plants were grown in the greenhouse at University of California, Riverside. The scion was a open-pollinated (very probably selfed) seedling of Poncirus trifoliata cv Pomeroy that was selected as homozygous for the Ctv resistance gene. The rootstock was sweet orange infected with citrus tristeza virus (CTV) isolate T514 over 1 year before sampling (CTV infects sweet orange, but not genotypes carrying the Ctv resistance gene. Shoots 10-30 cm long were harvested in October 2000, and the green phloem (bark) was removed and frozen quickly in dry ice. Total RNA was purified, a CDNA library was made, and 0.5 million primary lambda cDNA library was made, and 0.5 million primary lambda cDNA library was made, and 0.5 million primary lambda cDNA plasmid DNA purified, cDNA clones were in vivo excised to give a population of palsmid DNA purified, cDNA clones archived, and DNA sequences determined bi-directionally using an ABI3730 at the Arizona Genomics Institute, University of Arizona (Collura, Peuerbacher, Kim, Kudrna, Wing, Yu).

Chromatogram files were transmitted to UC Riverside (by Yu), then processed at UC Riverside (by Wanamaker) using the HarvEST pipeline (http://harvest.ucr.edu) to remove vector and cloning oligo sequences and various contaminants, and to trim to a high quality region. Sequences that retained a phred 17 region of at least 100 bases were deposited to cenBank."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /dev_stage="10 - 30 cm shoots"

during a cold spell, when pre-dawn temperatures were approximately -2 to 2 degree C. Approximately 2 cm median sections of the rind were excised in the field from several fruits, then wrapped in aluminum foil and frozen quickly in dry ice. Total RNA was extracted using a phenol extraction procedure described in J. Japanaese Soc. Hort. Sci. (1996) 64:809-814. Poly(A) RNA was purified, a cDNA library was made, and 1 million primary lambda cDNA clones were in vivo excised to give a population of pBluescript SK(-) phagemids. All steps to this point were performed in the TJ Close lab at the University of California, Riverside (Fenton). Phagemids were plated, DNA sequences determined bi-directionally using an ABIS50 at the Arizona Genomics Institute, University of Arizona (Collura Feuerbacher, Kim, Kudrna, Wing, Yu). Chromatogram files were transmitted to UC Riverside (by Yu), then processed at UC Riverside (by Wanamaker) using the HarvEST pipeline (http://harvest.ucr.edu) to remove vector and cloning oligo sequences and various contaminants, and to trim to a high quality region. Sequences that retained a phred 17 region of at least 100 bases were deposited to GenBank."

Site_1: EcoRI; Site_2: XhoI; Plants were grown in the
field at University of California, Riverside Agricultural
Operations since 1983. The scion was Washington Navel
orange and the rootstock Carizzo Citrange. Tissue from
mature fruit was harvested at mid-day in January 2002
during a cold spell, when pre-dawn temperatures were
approximately -2 to 2 degree C. Approximately 2 cm median
sections of the rind were excised in the field from
several fruits, then wrapped in aluminum foil and frozen
quickly in dry ice. Total RNA was extracted using a phenol
extraction procedure described in J. Japanaese Soc. Hort.
Sci. (1996) 64:809-814. Polly(A) RNA was purified, a cONA
library was made, and 1 million primary lambda cDNA clones
were in vivo excised to give a population of pBjuescript
SK(-) phagemids. All steps to this point were performed in
the TJ Close lab at the University of California,
Riverside (Fenton). Phagemids were plated, plasmid DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /cultivar="Washington Navel"

Chromatogram files were transmitted to UC Riverside (by Yu), then processed at UC Riverside (by Wanamaker) using the HarvEST pipeling (http://harvest.ucr.edu) to remove vector and cloning oligo sequences and various contaminants, and to trim to a high quality region. Sequences that retained a phred 17 region of at least 100 bases were deposited to GenBank."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           42.2%;

/note="Organ: Berry; Vector: pDNR; Site 1: Sfil; Site 2:
Sfil; CAB7 is a cDNA library of Cabernet Sauvignon Clone 8
berries. Samples were collected post-veraison from
field-grown vines during stage III of berry growth at 89
days after full bloom. Berries soluble solid concentration
ranged between 18-19 brix. Sampled vines were located at
the University of California, Davis, Experimental
Vineyard. cDNAs were made by oligo-dT priming and directi
onally cloned. 5'and 3' adaptors were used in cloning as
follows: 5'-AAGCACTGGTATCACCCAGACTGGCCATTACCGCGG-3' and
5'-ANTCTAGACGCCGACTGGTATCACCCAGACTGGCCATTACCGCCGG-3'
Size-selected to contain the 0.5-3 kb size fraction."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /cubic_TVector: DBluescript II SK+; Site 1: EcoRI; Site 2: /note="vector: DBluescript II SK+; Site 1: EcoRI; Site 2: /note="vector: DBluescript II SK+; Site 1: EcoRI; Site 2: XhoI; The cDNA library was constructed from mRNA isolated from stem tissue of 1 month old greenhouse grown plants for the cultivar Raiden. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with a XhoI restriction site. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the EcoRI-XhoI restriction site of the pBluescript vector. The ligated CDNA fragments were transformed into DHIOB host cells (glbcoBRL). This library was constructed in the laboratory of Dr. Randy Shoemaker."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Soybean

Inches Processor: Lambda Uni-ZAP XR, excised phagemid;
Site 1: EcoRI; Site 2: XhoI; Plants were grown in the greenhouse at University of California, Riverside. The scion was a open-pollinated (very probably selfed)
seedling of poncirus trifoliata cv Pomeroy that was selected as homozygous for the Ctv resistance gene. The rootstock was sweet orange infected with citrus tristeza virus (CTV) isolate T514 over 1 year before sampling (CTV infects sweet orange, but not genotypes carrying the Ctv resistance gene. Shoots 10-30 cm long were harvested in October 2000, and the green phloem (bark) was removed and frozen quickly in dry ice. Total RNA was extracted using Trizol reagent (Gibco). Polly(A) RNA was gurified, a cONA clones were in vivo excised to give a population of pBluescript SK(-) phagemids. All steps to this point were performed in the ML Roose lab at the University of California, Riverside by X. Ye. Phagemids were plated, plasmid DNA purified, cDNA clones archived, and DNA sequences determined bi-directionally using an ABI3730 at the Arizona Genomics Institute, University of Arizona (Collura, Feuerbacher, Kim, Kudrna, Wing, Yu). Then processed at UC Riverside (by Wanamaker) using the HarvEST pipeline (http://harvest.ucr.edu) to remove vector and cloning oligo sequences and various contaminants, and to trim to a high quality region. Sequences that retained a phred 17 region of at least 100 bases were deposited to GenBank."
